

# EXHIBIT B

#### Description of the feature in pri order:

1. Open apps can provide info through their task tile (beyond just window title)
2. Open applications can be controlled from their task tile
3. Tiles have a flyout that offer more status and control
4. Tiles can be larger than one line if need be. (makes sense when stacked vertically in a bar)
5. When space is short, the tiles shrink in an intelligent way. (mfu stay big)
6. Background apps and services can provide ui in a similar way (replace need for deskbands; more standard ui for tray items)

#### UI states:

- Tile: just one line
- Large tile: Up to n lines
- Flyout: standard menu available from tile
- Window: normal restored or maximized window

#### Transition between large and small tile:

- No room for each tile to be large
- Only MFU get to be large
- Details...

#### Glommed windows use flyout?

#### Possible app uses

App	Tile controls	Flyout controls
Music player	Play/pause, next track, prev track, song title, volume	Playlists
Video player	Video, volume	Stop, fwd, rewind, open, volume

Language bar		

#### Start Page

#### Goals

- Status & notification (Welcome back.. What did I miss while I was away?)
- Expose breadth of the computer (Promote activity centers)
- Online - expose breadth of network (MSN home page)
- Give access to what a user is most likely to do
- OEM/partner/corporate branding
- Extension of welcome screen calendar (personal.net) (Richard Banks (personal.net design lead (hip)))
